AUDRUINO IDE SMART HOME SYSTEM

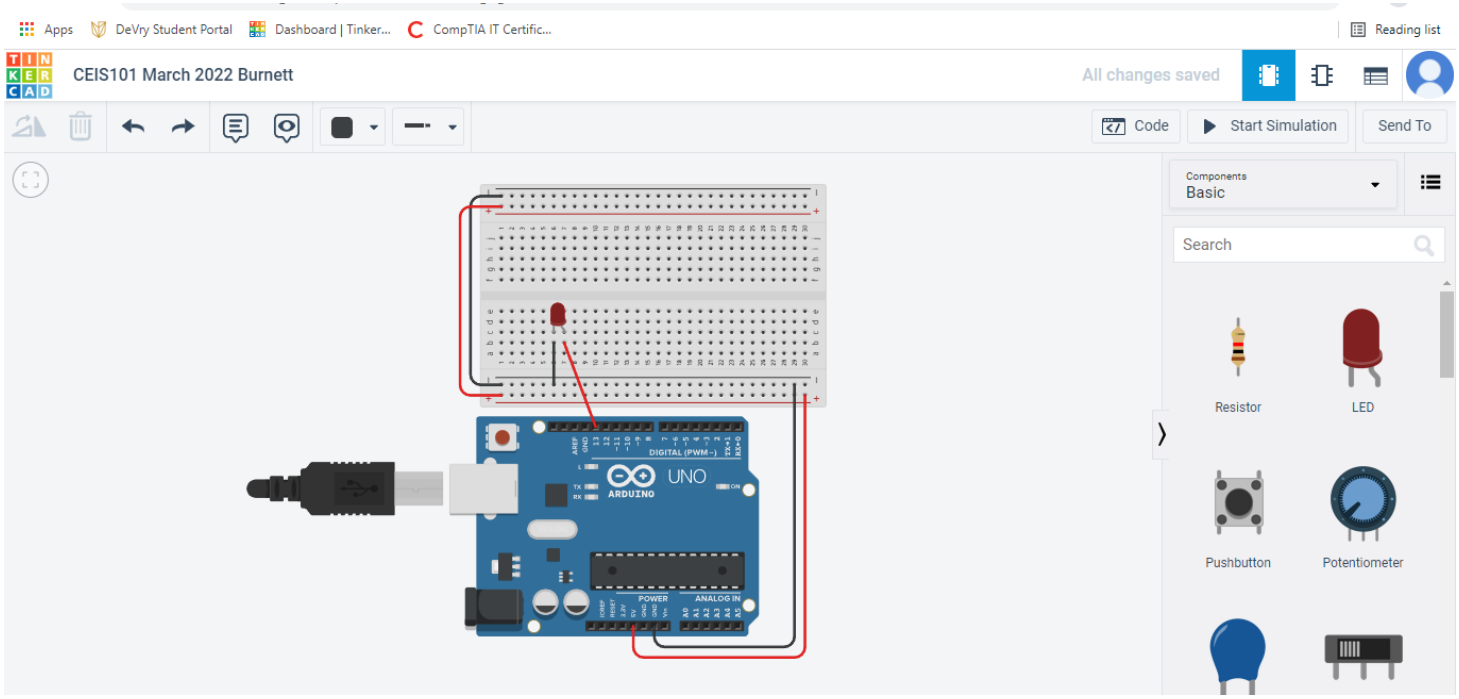
CEIS101 | Faith Burnett | DeVry University

CIRCUIT SIMULATION

- In the first part of the project, I will be using Tinkercad, a 3-D design and modeling program
- This is to gain an understanding of how a simple circuit for a blinking LED works

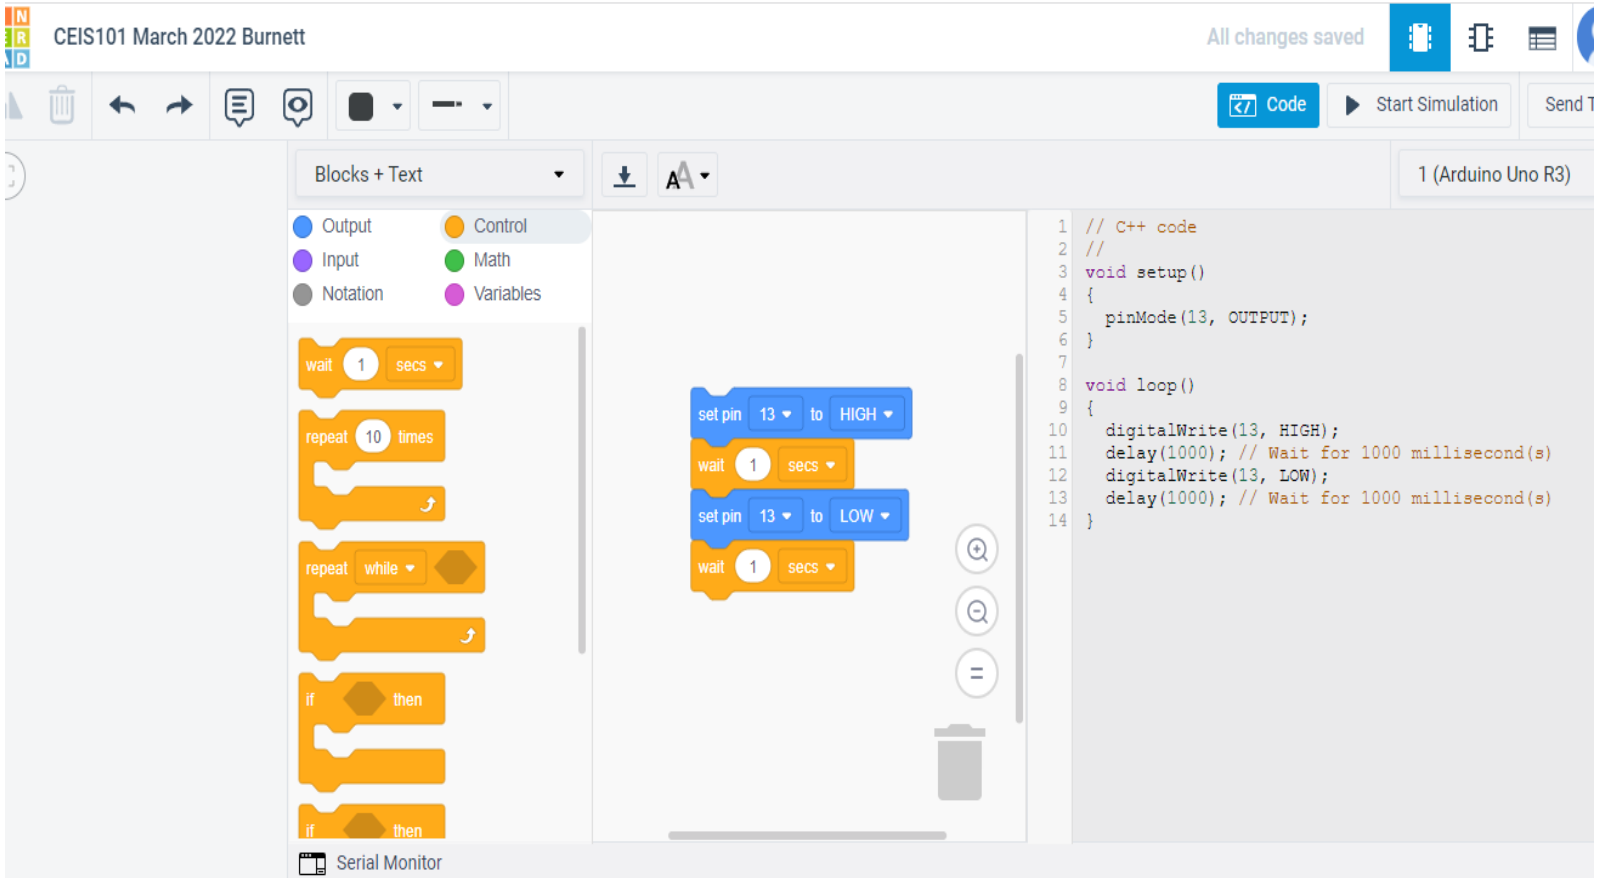
CONSTRUCTION OF CIRCUIT SIMULATION

- To the right you will see the Adruino breadboard starter, two jumper wires connect each set of rails ground to ground and power to power
- To connect the Arduino to the breadboard we also use two jumper wires ground connects to the ground pin and power connects to the 5v pin
- Next, we connect the LED, the shorter leg(Cathode) will be connected to the ground rail, The longer leg(Anode) will be connected to Pin13



CODING FOR LED CIRCUIT

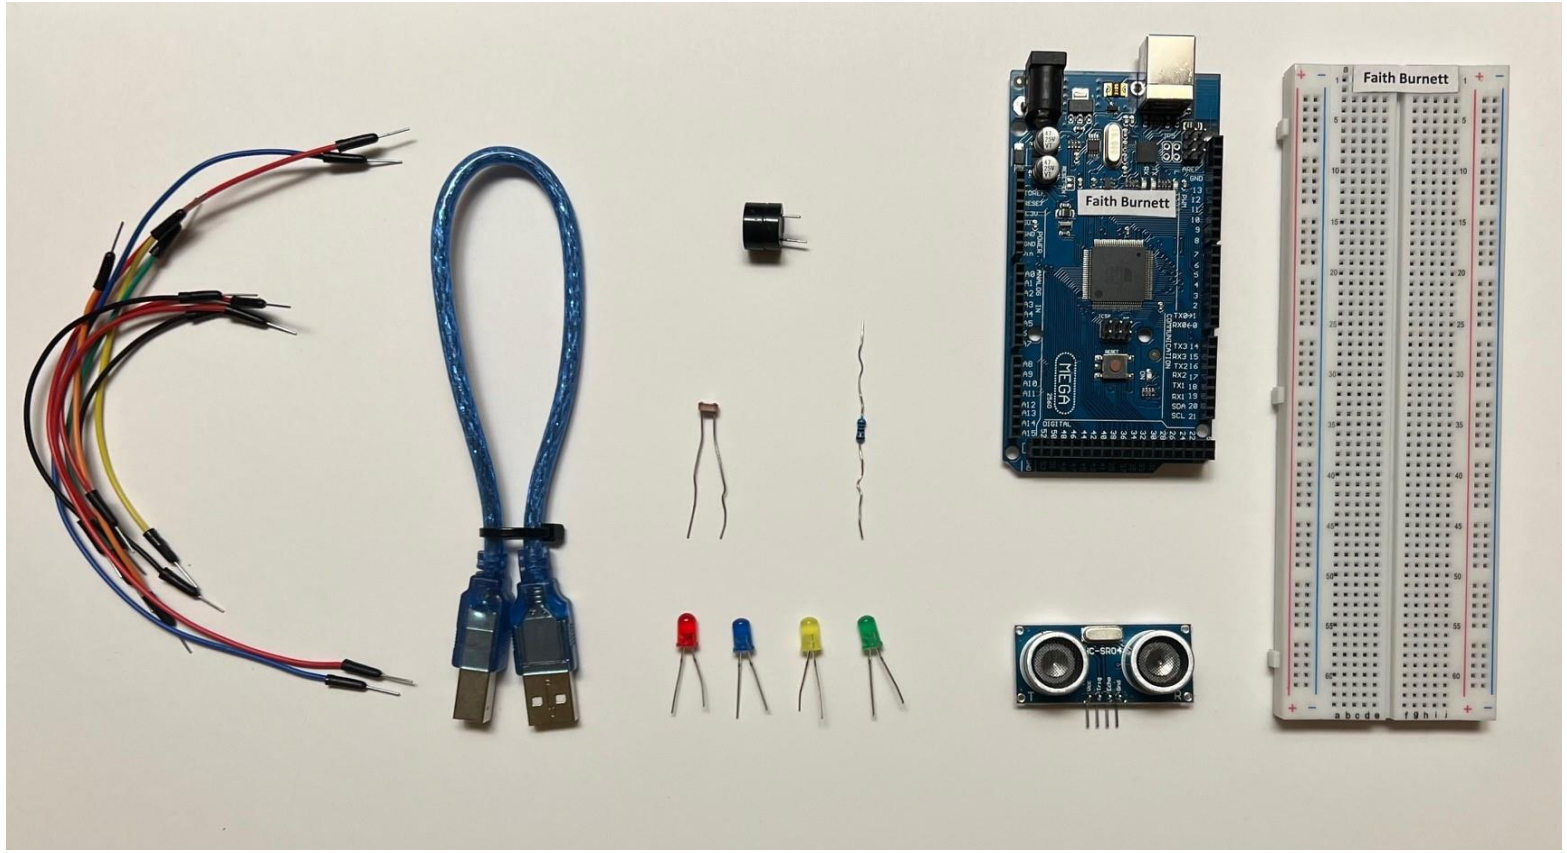
- In the setup function pin13 is being initialized as an output
- In the loop function pin13 will be set to go on(High) and off(Low) with a small delay in between depending on desired blink speed



IOT KIT INVENTORY

- UCTRONICS Kit
- ESP32 (2)
- LCD Modules (2)
- Breadboards (3)
- Mini Router
- Patch Cable
- Digital Multi Meter
- USB to Micro USB (2)

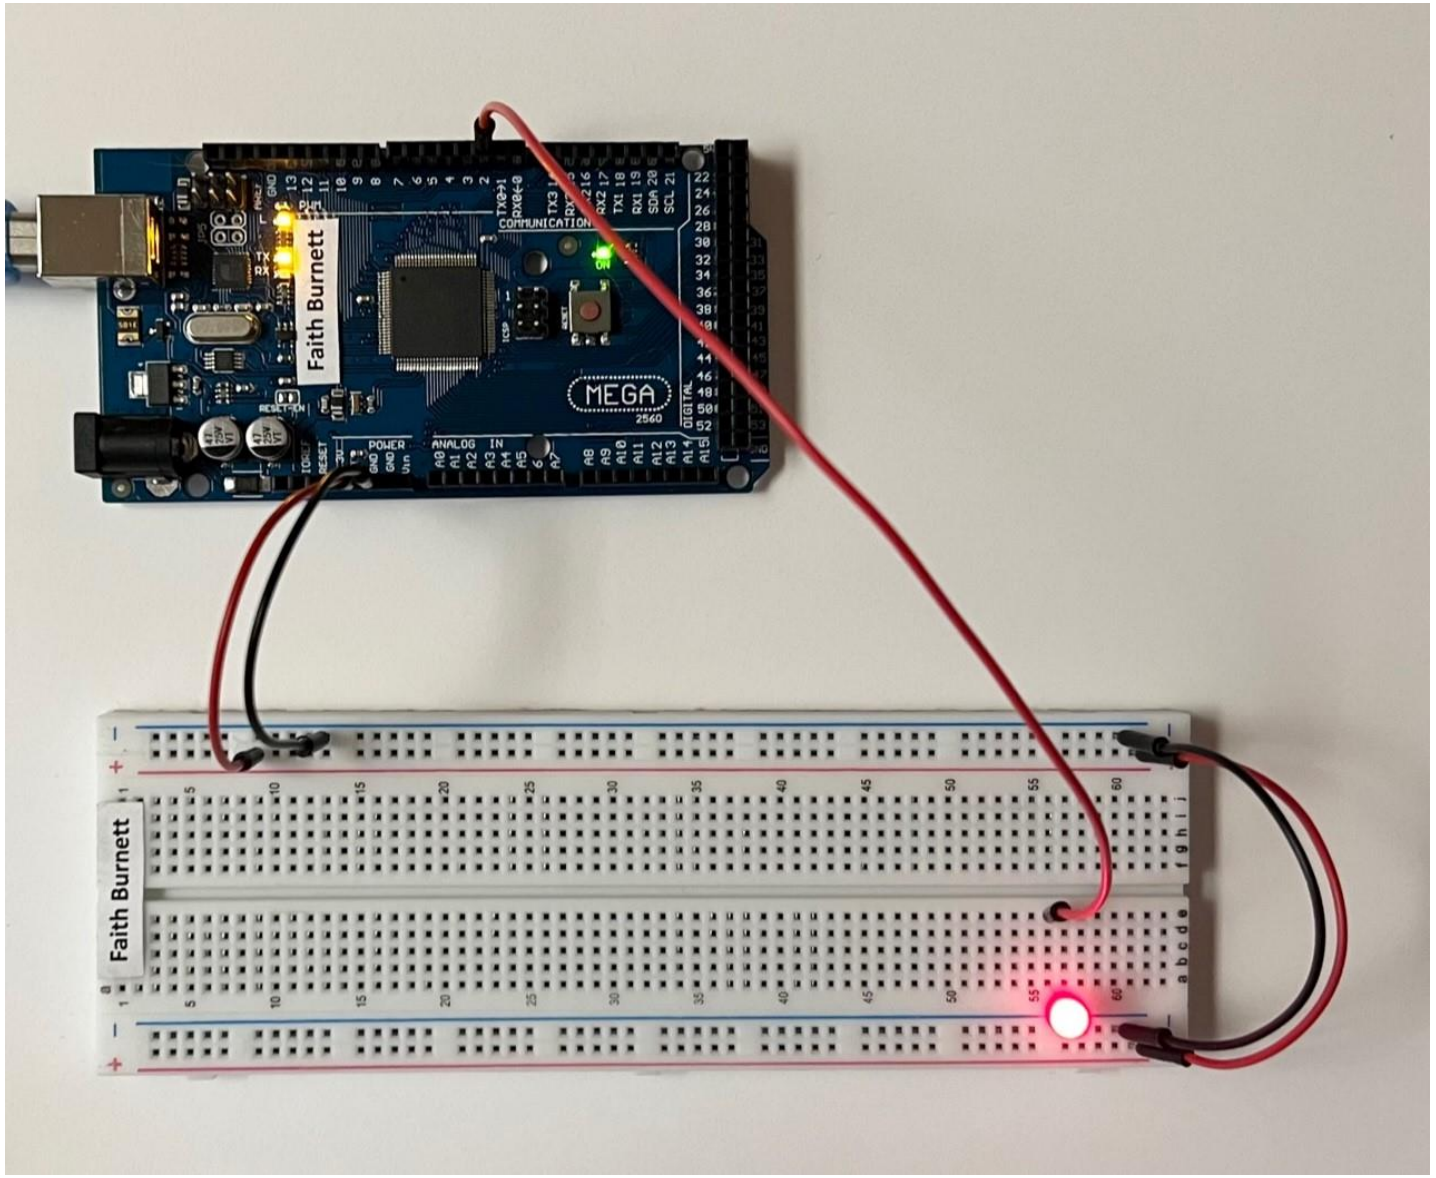
PROJECT COMPONENTS



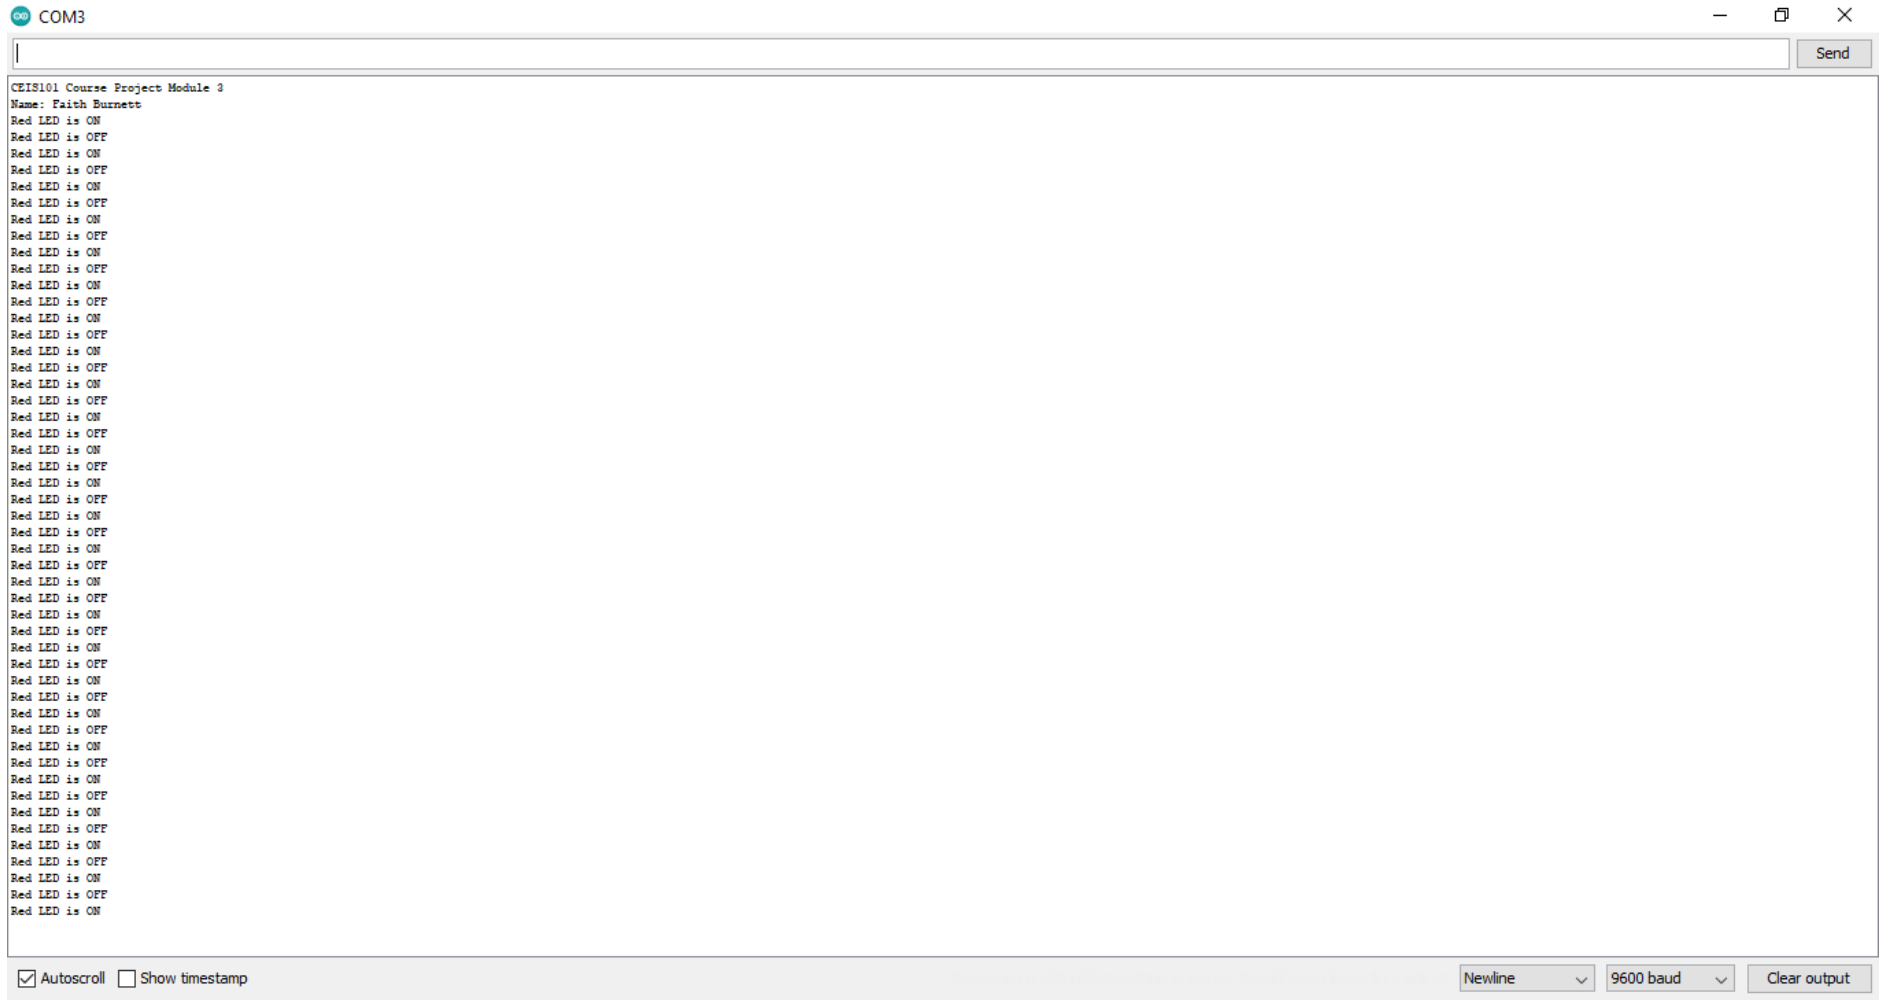
- Adruino Mega 2560
- Breadboard
- Resistor 10kΩ
- LEDs
- Ultrasonic Sensor
- Active Buzzer
- Photoresistor
- Wires
- USB Type B cable

THE PHYSICAL CIRCUIT

- As demonstrated in the simulated circuit the Arduino and rails are connected using the jumper wires
- The LED is connected to the ground rail and then to pin2(any of the digital pins could be used in place of pin2)



SERIAL MONITOR

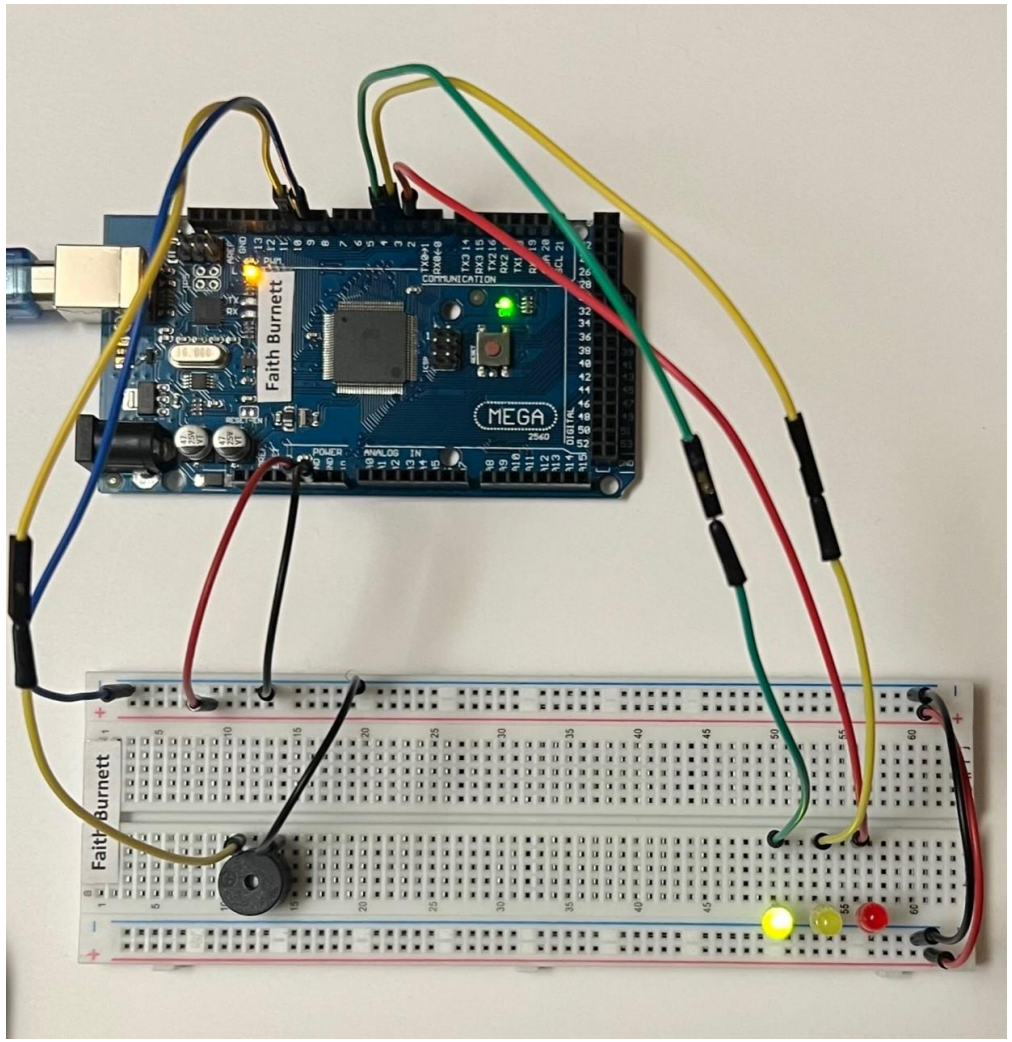


DOOR SENSOR

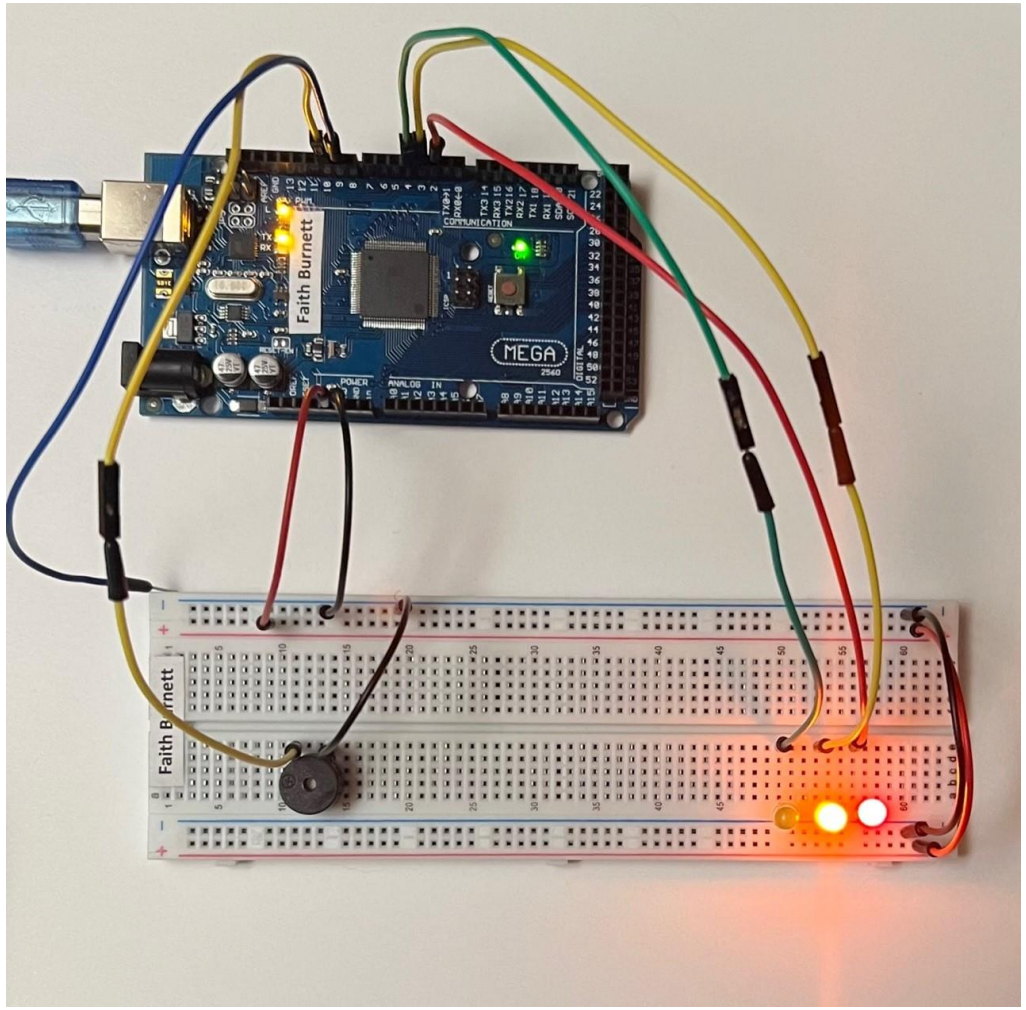
- In this section of the project, I will be adding two additional LEDs, representing levels of security risk, and an active buzzer representing an alarm
- A blue jumper wire will act as the door

GREEN LED ON/DOOR CLOSED

- Green and yellow LEDs are now connected to pins 3 and 4
- The active buzzer is connected, black wire to ground on breadboard and yellow to pin 10 for power
- The blue wire(“the door”) is connected to pin9 allowing the green LED to be lit and showing us that the door is closed

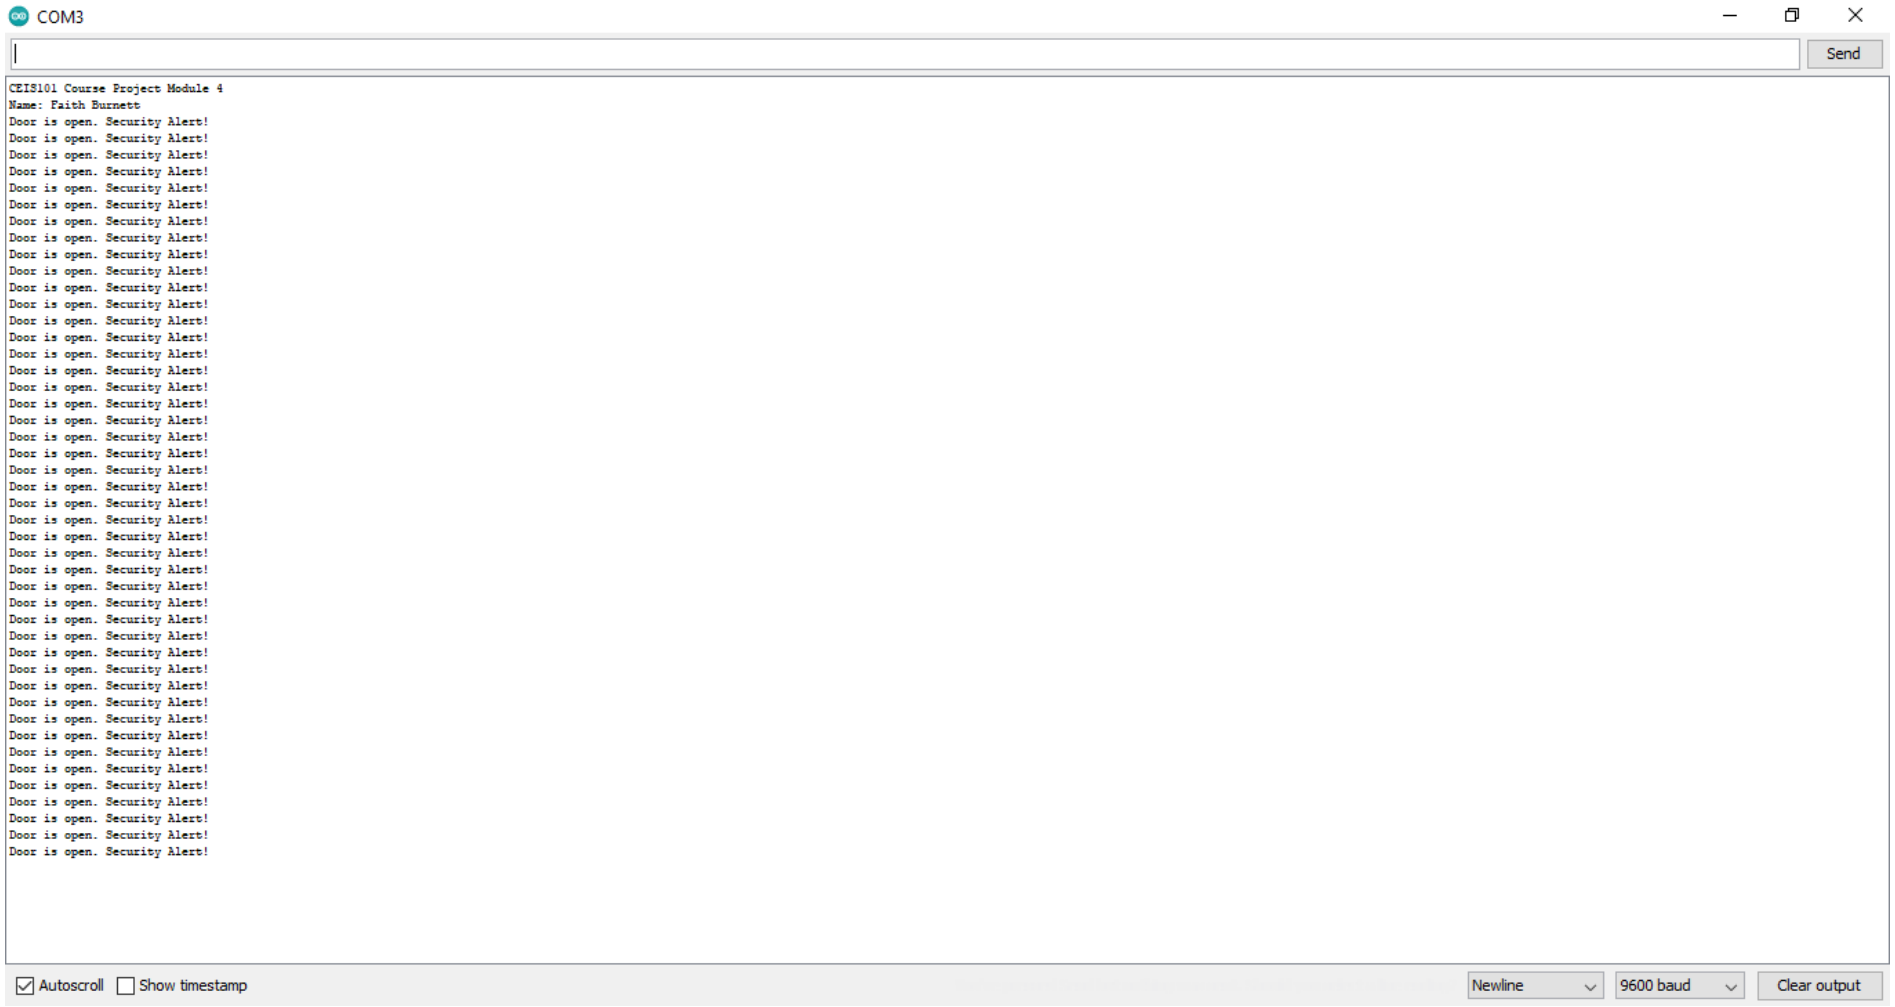


YELLOW AND RED LED ON/DOOR OPEN

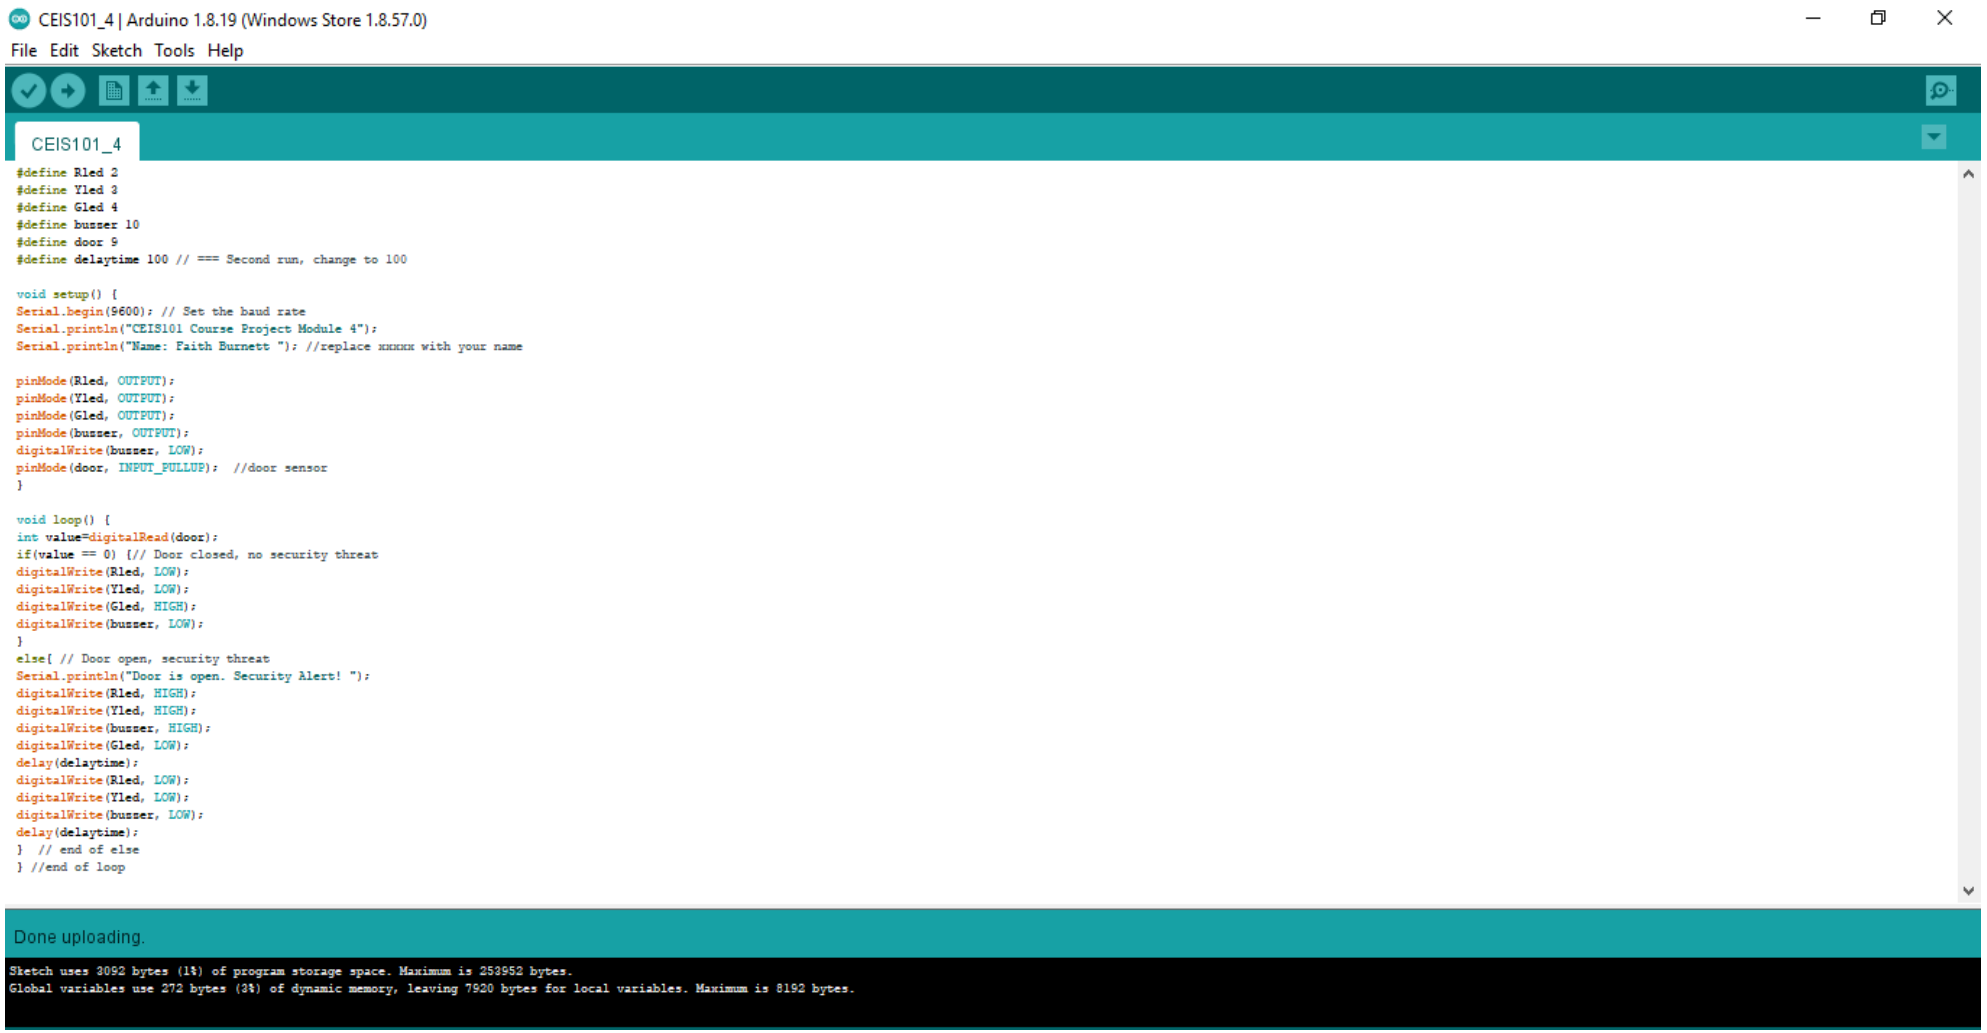


- The blue wire has been disconnected
- The active buzzer is going off and yellow and red LEDs are on
- The alarm tells me that the door is open, the lights are possibly a deterrent for culprit

SERIAL MONITOR



CODE FOR DOOR SENSOR

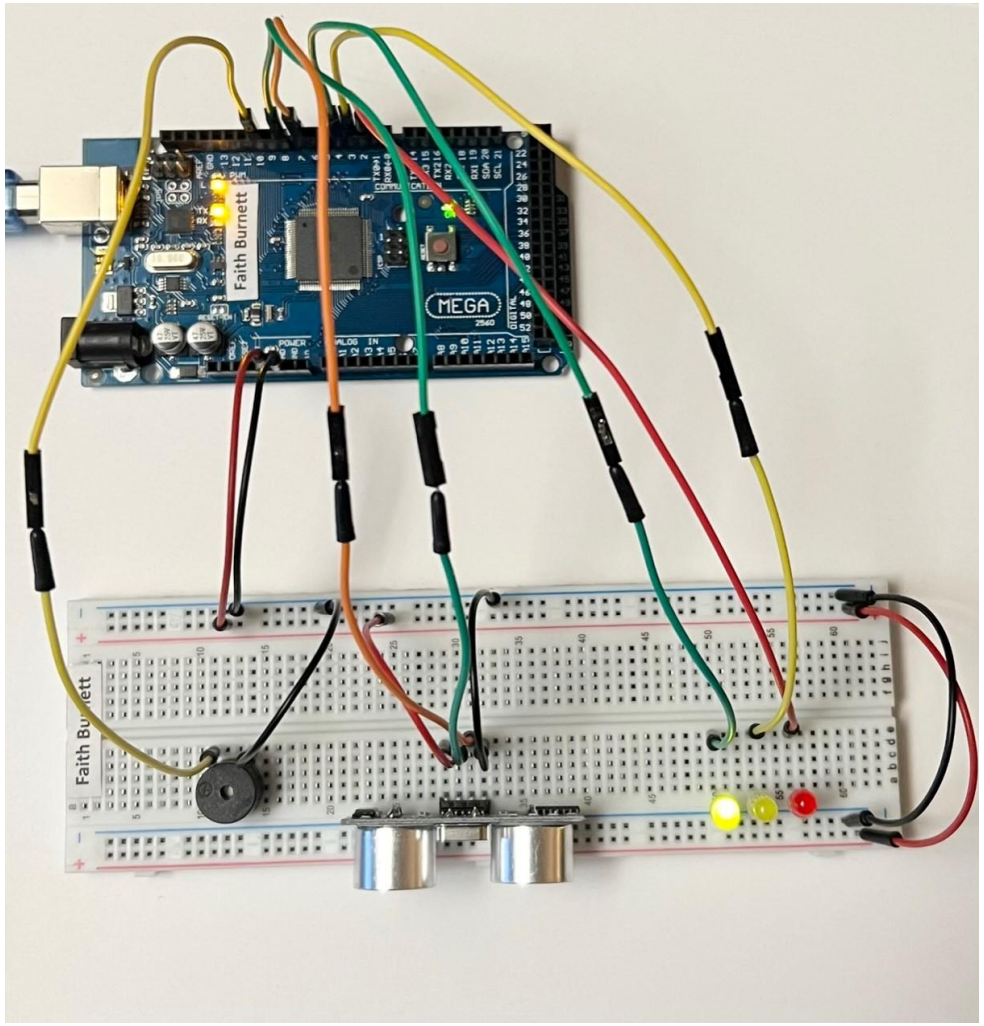


DISTANCE SENSOR

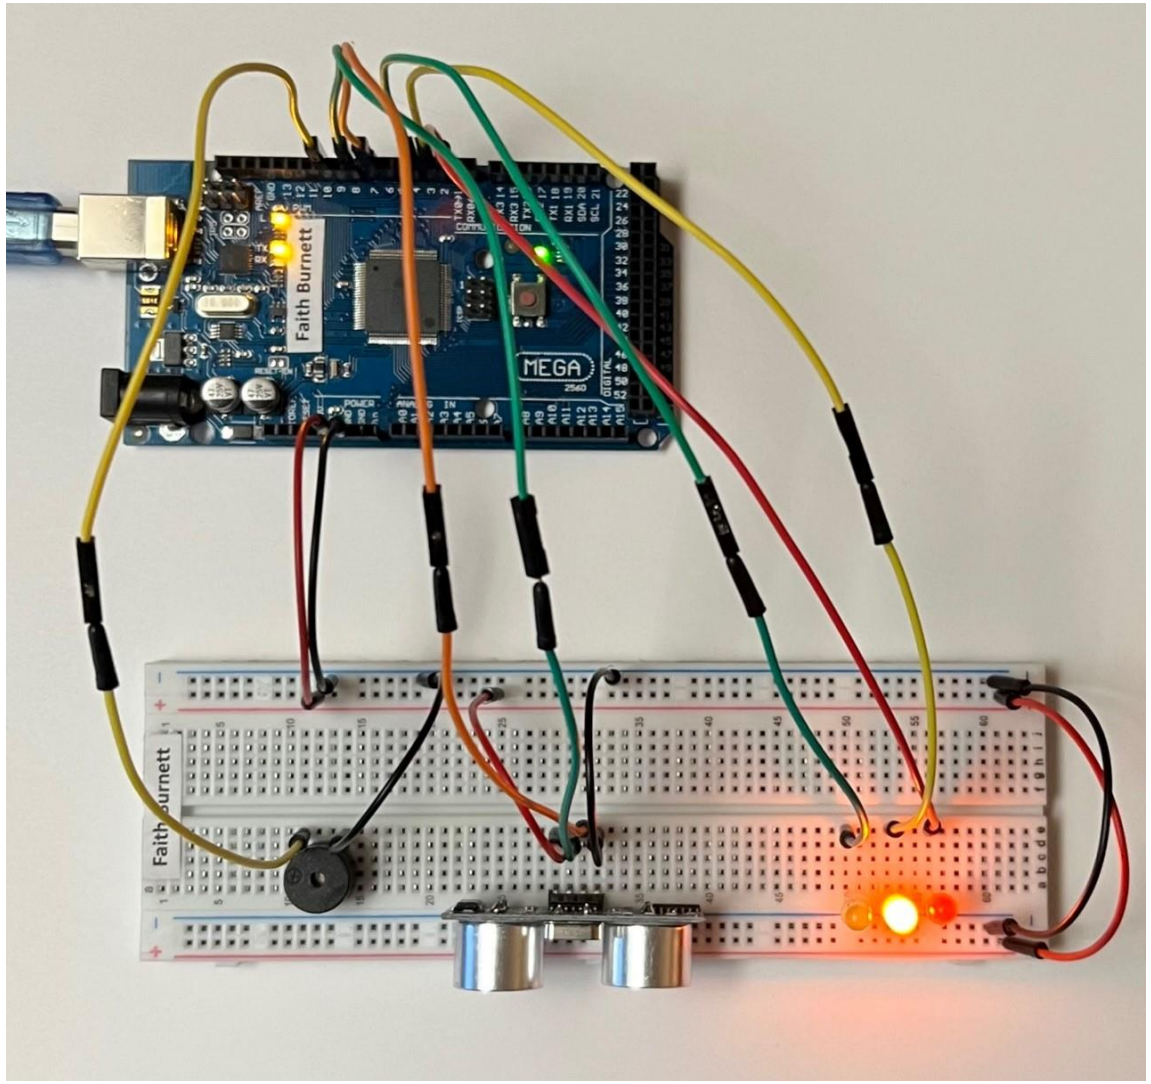
- Adding an ultrasonic sensor allows for a better method of detecting risks
- In this stage the active buzzer will fluctuate in tones based on what level of risk is detected
- The LEDs will individually light up when the corresponding level of risk arises

LOW RISK

Green LED is on meaning we are at low to no risk



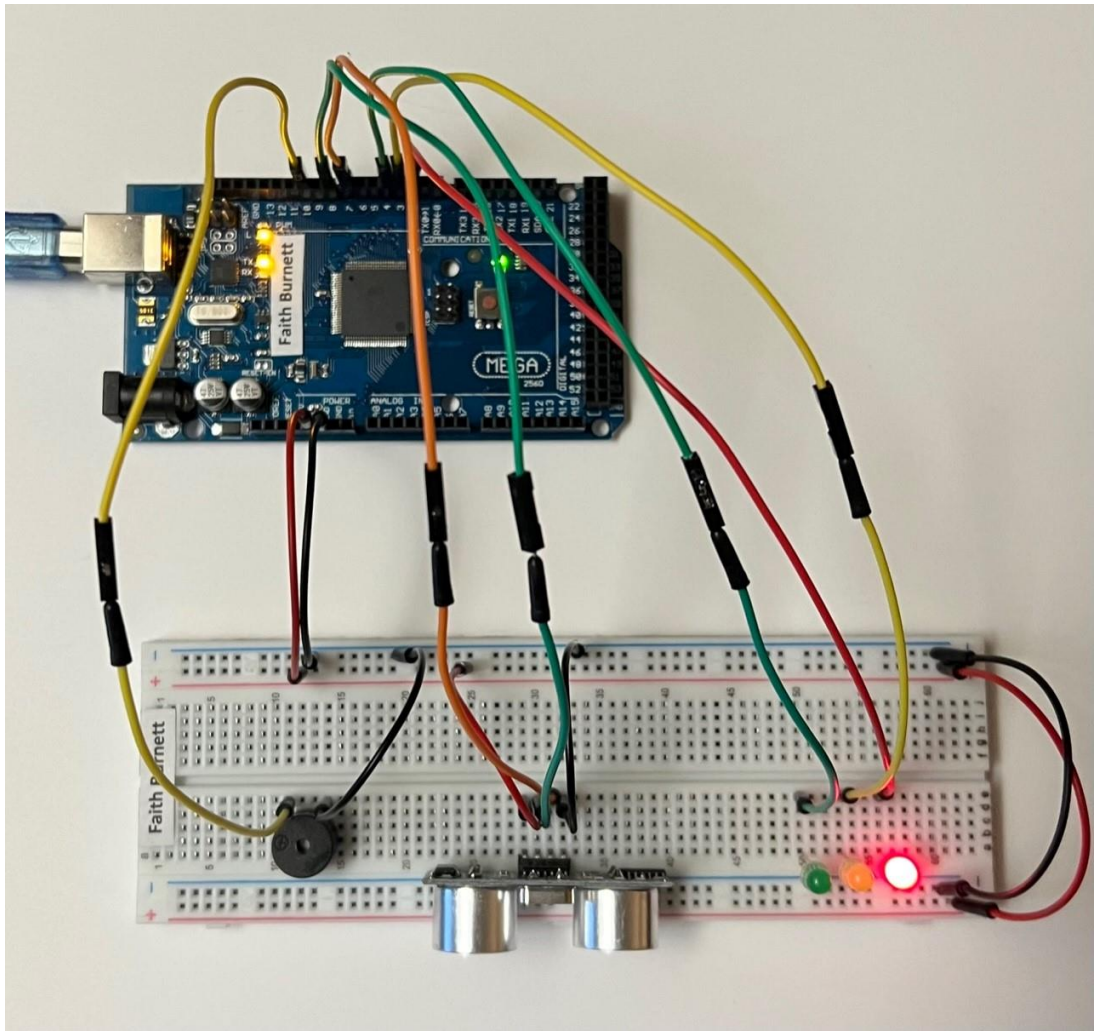
MEDIUM RISK



- There is a medium level of risk and the yellow LED is on
- A slightly high pitched alarm is sounding from the active buzzer

HIGH RISK

- There is a high risk detected the red LED is now on
- A high pitched alarm is sounding from the active buzzer



DATA COLLECTION

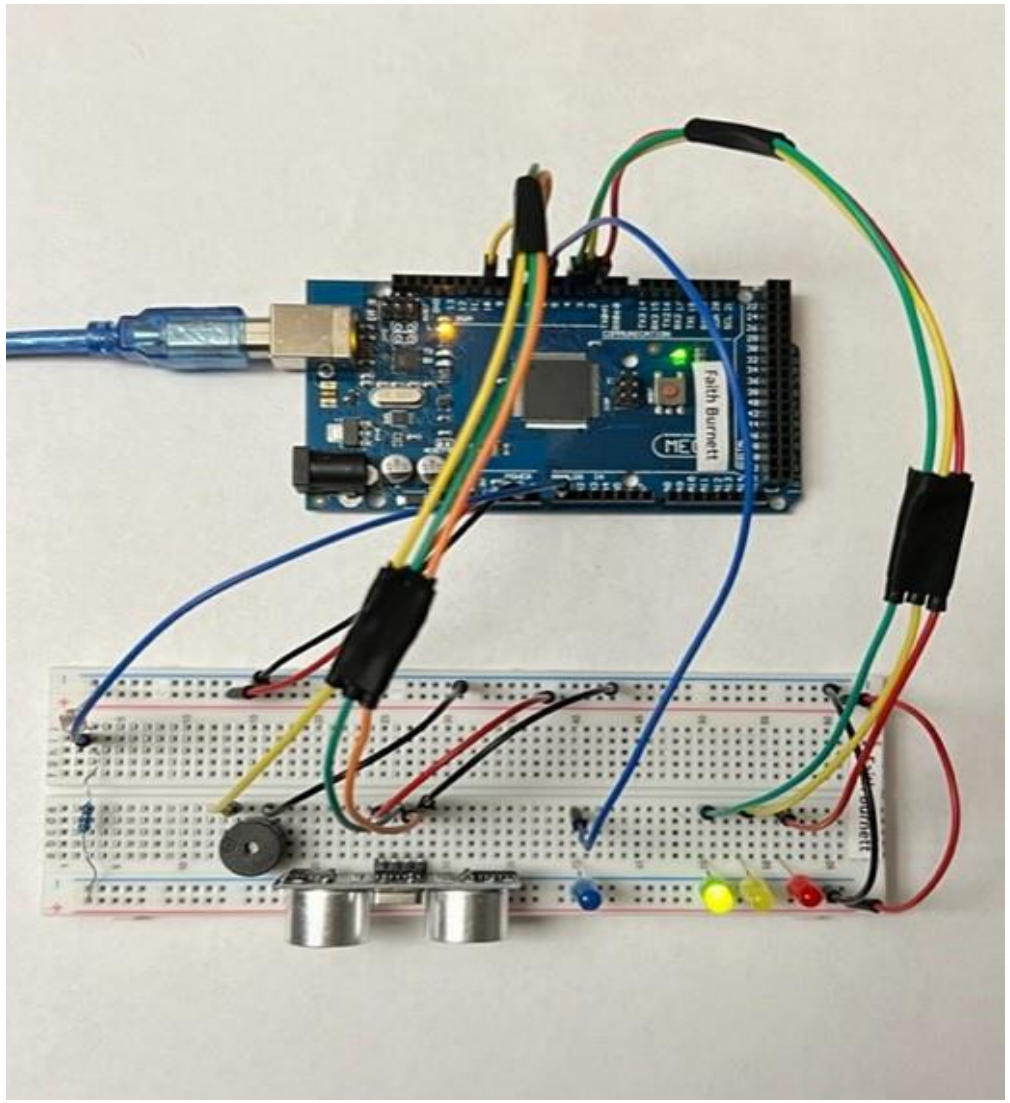
AUTOMATED LIGHT

- The photoresistor will act as a light sensor for the home system
- A blue LED will be our indicator for when light has been detected

AUTOMATED LED OFF



The blue LED is off meaning the photoresistor has detected light

AUTOMATED LED ON

- By covering the photoresistor the blue LED will turn on
- This emulates an automatic light coming on when it gets dark

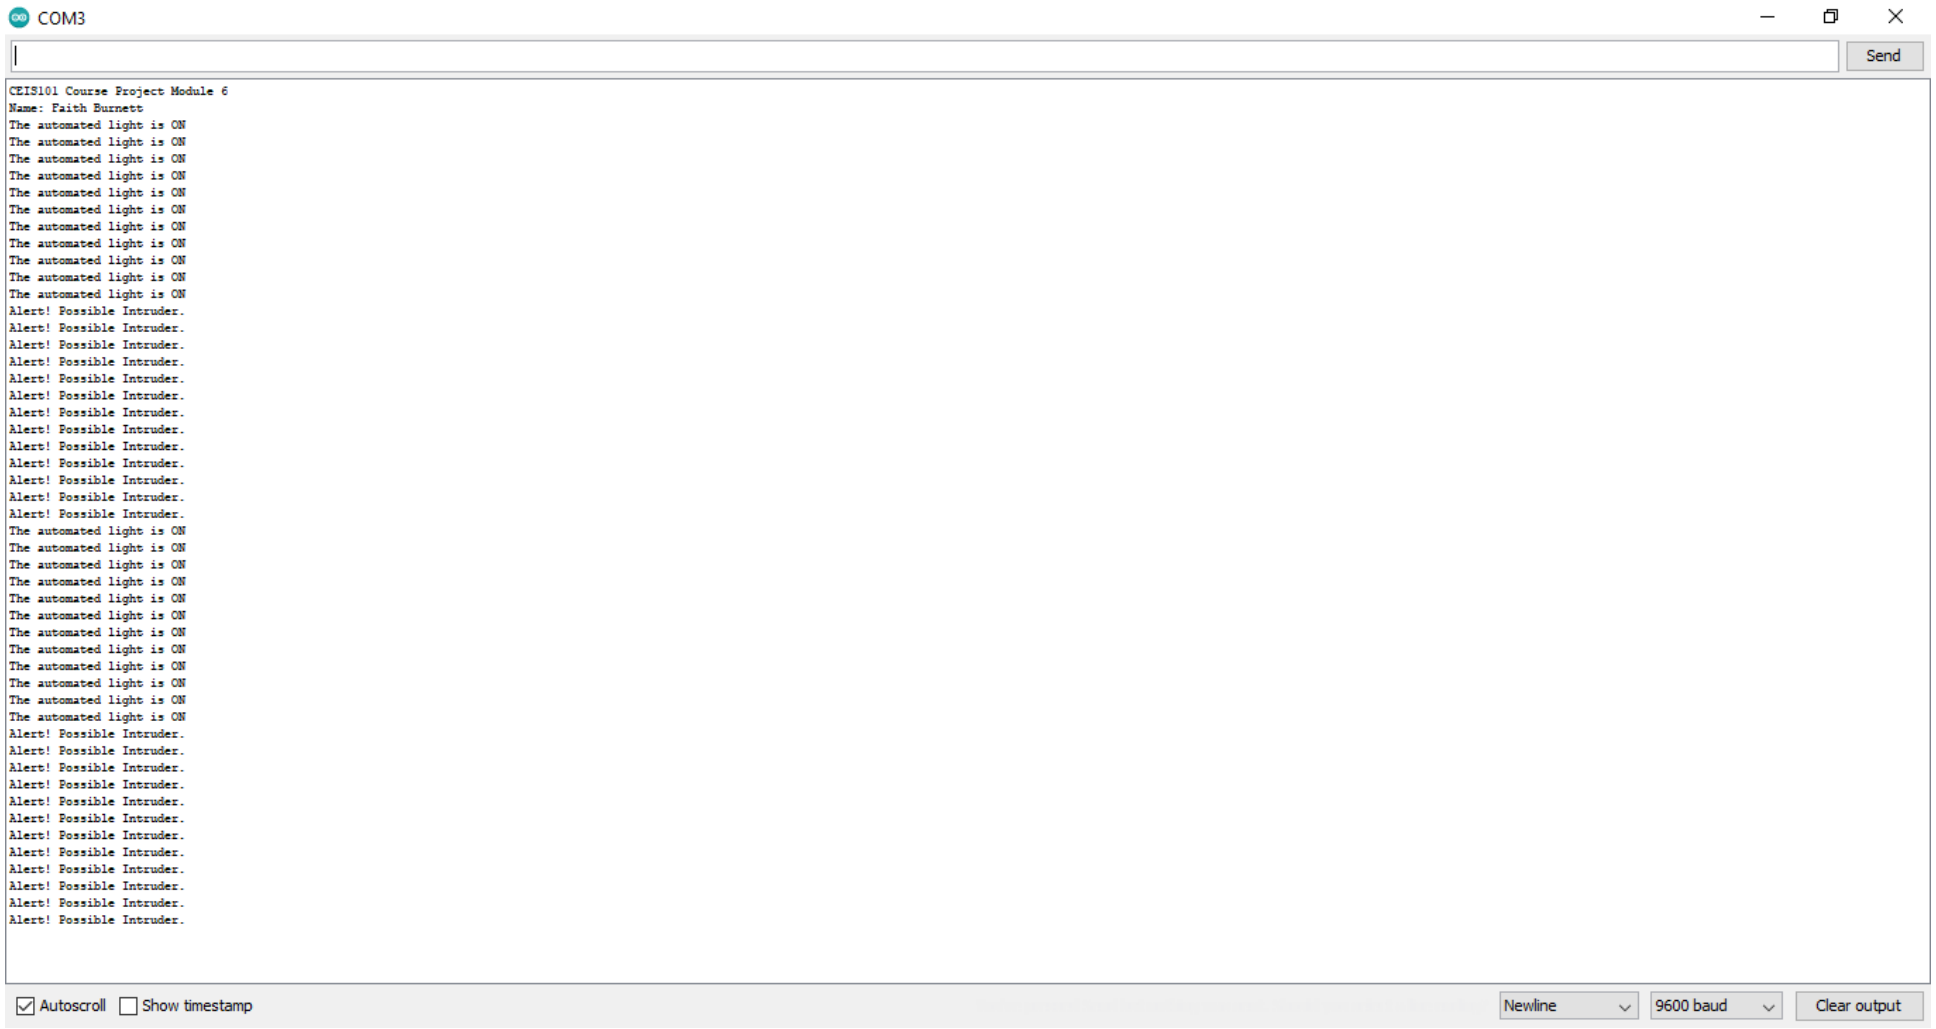
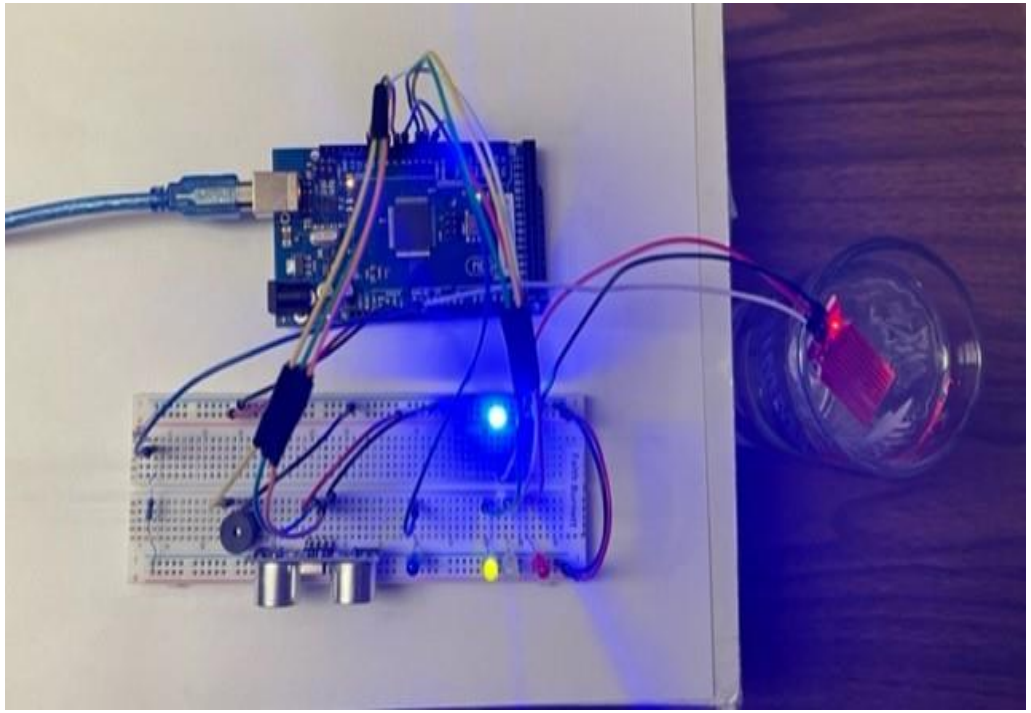
SERIAL MONITOR



WATER SENSOR & DHT-11

- Adding a water sensor will help us detect a possible flood
- The DHT-11 will give the humidity and temperature of the home

WATER SENSOR



The water sensor is connected to another blue LED that will fluctuate the lights intensity based on the level of water

DHT-11

Connecting the DHT-11will light a red LED on the component itself letting me know that it is powered and ready to be used
